

Set default user privileges

New users can be created two ways. They can be [set up by the knowledgebase administrator](#), or users can [register](#) themselves.

By default, when users register KBPublisher creates them with no privileges. You can change this so that new users are created with a specific default privilege by:

- From the **Settings** menu choose the **Public Area** tab
- Go to the **Security / Privacy / Registering** section
- Select the appropriate **Privilege for new registered users** from the drop-down list of privileges
- Click **Save**.

All new users who register after this are created with the new default privilege.

You must have administrator access to change the settings.
