

# Using LDAP Authentication

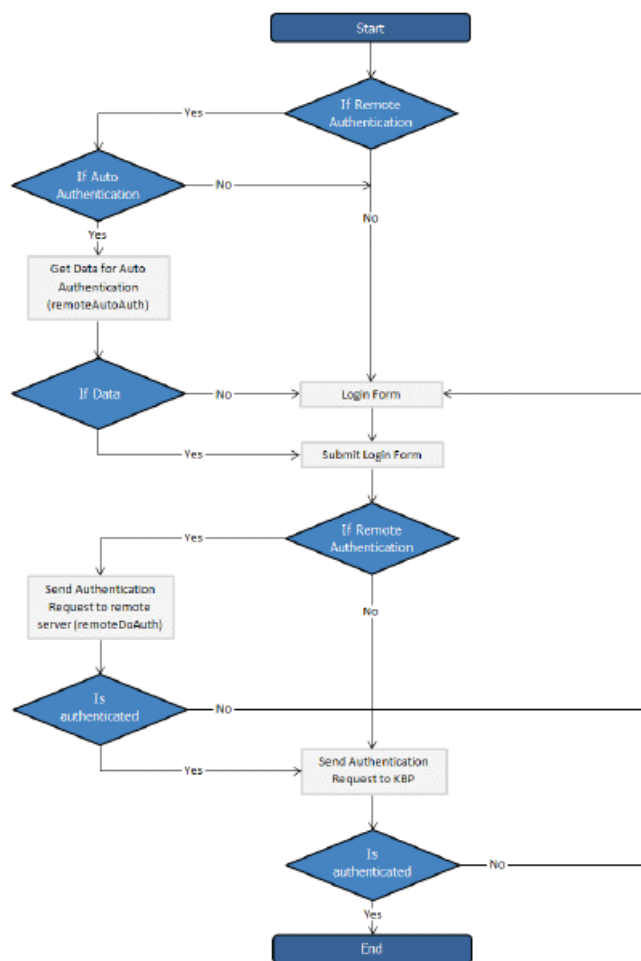

LDAP authentication allows you to integrate your organization's authentication system with KBPublisher. Configuration requires only a few simple steps.

## Steps to enable LDAP Authentication

- See [this article](#) for details

## Quick summary of the process

- End user goes to site
- User fill the login form
- Remote Authentication checks for valid user credentials
- KBPublisher authenticates the user

## Tracking logins

You can see how your remote authentication works in logs Logs/Logins

For debugging every last login is logged to a file called *last\_remote\_login.log* in the KBPublisher cache directory (*APP\_CACHE\_DIR* in *admin/config.inc.php*).

For example: */home/username/ kb\_cache/last\_remote\_login.log*
