

Using SAML SSO Authentication

Security Assertion Markup Language (SAML) is a standard for logging users into applications based on their sessions in another context. This single sign-on (SSO) login standard has significant advantages over logging in using a username and password. SAML is very powerful and flexible, but the specification can be quite a handful.

Steps to enable SAML SSO Authentication

- See [this article](#) for details

Tracking logins

You can see how your [remote authentication](#) works in the KBPublisher login logs, located under **Logs > Logins**.

For debugging, the most recent remote login is logged to a file called *last_remote_login.log* in the KBPublisher cache directory (*APP_CACHE_DIR* in *admin/config.inc.php*). For example: */home/username/kb_cache/last_remote_login.log*
